Introducing SPECTRUM Membranes

SPECTRUM uses state-of-the-art technology to manufacture a range of high-performance membrane products.

Factors that affect membrane performance

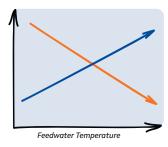

Operating Pressure

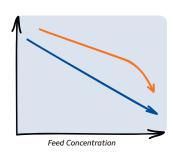

The amount of permeate water that an RO membrane will produce is directly affected by the operating pressure. As pressure increases the amount of permeate produced also increases along with the rejection rate to a certain point.

Feedwater Temperature

Feedwater temperature will have a dramatic effect on RO membrane permeate production and rejection rate. The higher the feedwater temperature the higher the permeate production and the lower rejection rate.

Feed Concentration

The higher the feedwater concentration the lower the permeate flow and % rejection rate of the RO membrane. Increasing the operating pressure can counter this effect.

ERO vs SRO

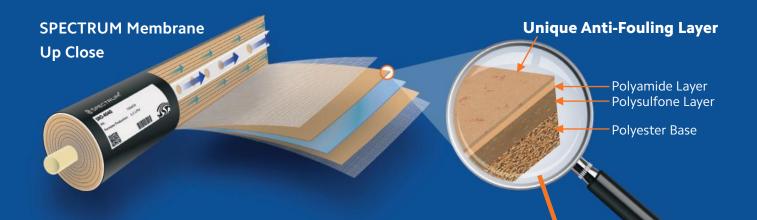

When it comes to choosing a membrane, it is important to consider the application requirements and the membrane's operating specifications. SPECTRUM's offering of commercial and industrial RO membranes has two ranges to provide a solution for a variety of application conditions.

ERO (High Production, Lower Pressure)

With an average rejection rate of 99%, the ERO range of membranes has been designed to deliver higher permeate flow rates in lower pressure applications. Whilst an optimum balance of performance is achieved at 10.3 bar, the ERO delivers exceptional performance at pressure as low as 6.9 bar, which is perfectly suited to tap water applications with a feed water concentration typically of 500 mg/l or less.

SRO (High Rejection)

For applications that demand higher permeate quality, the SRO range has been manufactured to deliver consistent permeate quality from higher concentration feed water sources up to 10,000 mg/l. Operating at 15.5 bar and with an average rejection rate of 99.5%, the SRO range is perfectly suited to industrial processes, such as boiler feed and microelectronics.

Media Innovation

For a long life membrane

Reverse osmosis membranes are renowned for being extremely susceptible to both physical damage and plugging. The complex structure of a normal RO membrane can be prone to premature organic fouling, reducing permeate production, resulting in early changeout.

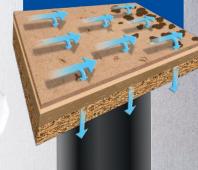

To lower energy consumption and extend element life, SPECTRUM RO membrane is cast uniquely with an additional anti-fouling layer applied to the surface of the flatsheet. This additional anti-fouling layer makes the external surface of the flatsheet smoother, reducing the binding sites of potential membrane foulants whilst creating a more neutral membrane surface to reduce interaction with charged ions.

Traditional membranes since 1960's (Untreated Surface) Complex structure, prone to premature organic fouling, reducing permeate production

SPECTRUM RO Membranes (Smooth anti-fouling layer)

With an added anti-fouling layer, foulants are less attracted to membrane surface

4" Membranes

Higher Flow, Lower Energy

Advancing every area of the user experience, making the SPECTRUM 4" not just a retrofit but a system upgrade. Starting with logistics, where the fibreglass outer finish adds security, as does the strengthened packaging. Storage is improved with extended shelf life, installation rinse-up time is dramatically reduced, higher flow at lower energy consumption is achieved during operation, whilst increasing permeate quality, and membrane life is extended due to the anti-fouling media.

Specification

4-45°C **Maximum Operating Temperature** 41 bar **Maximum Operating Pressure Minimum Operating Pressure** -ERO 6 bar -SRO 10 bar Maximum Feed Flow Rate 60 LPM

Minimum Feed Flow Rate 15 LPM **Maximum Recommended Recovery** 35 % pH Range, Continuous Operation 3-10

Standard vs Economic

Extending the performance capabilities of the Economic range, the SMH is ideal for use with SPECTRUM SRO membranes in higher TDS feed waters (>500 mg/L). Designed for more demanding applications, the Standard range provides superior performance.

Corrosion Resistant

Constructed from 316L stainless steel, the SMH provides extra corrosion protection, such as pitting from high chloride solutions.

Durability

With a 30% thicker body, the Standard range has increased strength and durability, suitable for harsh industrial environments.

Seamless

Manufactured from a seamless stainless tube, the SMH avoids the potential of long term weld corrosion for extended service life.

4" Membrane Housings

The Go-to For Commercial Pure Water Production

The preferred choice for commercial reverse osmosis systems, the SPECTRUM 4" stainless steel membrane housings are constructed with a highly polished stainless steel body to ensure membrane seal integrity. Typically lighter than comparable PVC or FRP alternatives, these housings feature two twin-port single piece ABS end-caps offering flexibility in both housing orientation and membrane flow pattern, whereby pure water can be collected at either end of the housing.

Operating Temperature
